

Task: What You'll Do

two visitors:

- Visitor A = A new user who came from Paid Search
- Visitor B = A returning user who came from Direct

3. Compare their experiences by answering:

- Who spent more time on the site?
- Who engaged with more content (sessions/events)?
- Who was more likely to trigger a key event?

Visitor A came from paid search. Visitor A 's journey search google, and clicked the ad to go to our product pages. The average engagement time is 39. Engaged sessions are around 66%. That means the bounce rate is 34%. Visitor A' s bounce rate is less than engaged sessions. They are interested in our website, so they stayed longer to explore the products. Key events are 125 and event count is 7462. It reveals the visitor A 's scroll the different pages, click the items and even add items to the cart.

Visitor B is a returning user who came from direct.Visitor B is a loyal customer and returns to explore initial products and new products. Average engagement time per active user is 22 and Engaged sessions is 45%, that means bounce rate is 55%. It reveals that visitor B is familiar with our website and doesn't spend too much time browsing which they purchased, however, the event count is 10230. It reveals that they are interested in deeply exploring product features and details, that' s why it has a higher event count than Visitor A (New Users) since new users need to build up trust before making the purchase. Returning users(Visitor B) had purchased our products and believed our brand. That's why they scroll and explore deeply to realize other products' features and details.

Output:

	Avg engagement time per active user	Engaged session per active user	Bounce Rate	Event Count
Visitor A (new from paid search)	39.12	0.66	0.34	7462
Visitor B(return from direct)	22.11	0.45	0.55	10230

2. What is the biggest difference you noticed between new and returning visitors?

The event count is the biggest difference between new and returning visitors. The new visitor's event count is 7462 and return is 10230. It reveals the visitor's behavior. New users are not familiar with our products. They need to purchase the product and experience them before making another purchase, so they don't have too many events. They scroll and click the items. However, return users have built trust with our products and spend more time scrolling and exploring other products' features or information. That's the reason why the event count is higher.

3. How do you think that changes the way we design a website experience?

According to the data, direct new users are 1652 and paid search new users are 1176. Their portion is larger than the return users. In order to grab the new user's attention, we should put more budget on organic ads and increase the new user's desired purchase.
